Table of Contents

Preface **3**

I An introduction to the techniques **11**

1 An introduction to approximation algorithms **13**
1.1 The whats and whys of approximation algorithms 13
1.2 An introduction to the techniques and to linear programming: the set cover problem 16
1.3 A deterministic rounding algorithm 19
1.4 Rounding a dual solution 20
1.5 Constructing a dual solution: the primal-dual method 23
1.6 A greedy algorithm 24
1.7 A randomized rounding algorithm 28

2 Greedy algorithms and local search **35**
2.1 Scheduling jobs with deadlines on a single machine 36
2.2 The k-center problem 37
2.3 Scheduling jobs on identical parallel machines 39
2.4 The traveling salesman problem 43
2.5 Maximizing float in bank accounts 47
2.6 Finding minimum-degree spanning trees 49
2.7 Edge coloring 54

3 Rounding data and dynamic programming **65**
3.1 The knapsack problem 65
3.2 Scheduling jobs on identical parallel machines 68
3.3 The bin-packing problem 73

4 Deterministic rounding of linear programs **81**
4.1 Minimizing the sum of completion times on a single machine 82
4.2 Minimizing the weighted sum of completion times on a single machine 84

4.3 Solving large linear programs in polynomial time via the ellipsoid method 86
4.4 The prize-collecting Steiner tree problem 88
4.5 The uncapacitated facility location problem 91
4.6 The bin-packing problem 95

5 Random sampling and randomized rounding of linear programs 105
5.1 Simple algorithms for MAX SAT and MAX CUT 106
5.2 Derandomization 108
5.3 Flipping biased coins 110
5.4 Randomized rounding 111
5.5 Choosing the better of two solutions 114
5.6 Non-linear randomized rounding 116
5.7 The prize-collecting Steiner tree problem 118
5.8 The uncapacitated facility location problem 120
5.9 Scheduling a single machine with release dates 124
5.10 Chernoff bounds 128
5.11 Integer multicommodity flows 132
5.12 Random sampling and coloring dense 3-colorable graphs 133

6 Randomized rounding of semidefinite programs 141
6.1 A brief introduction to semidefinite programming 141
6.2 Finding large cuts 143
6.3 Approximating quadratic programs 147
6.4 Finding a correlation clustering 150
6.5 Coloring 3-colorable graphs 153

7 The primal-dual method 161
7.1 The set cover problem: a review 161
7.2 Choosing variables to increase: the feedback vertex set problem in undirected graphs 164
7.3 Cleaning up the primal solution: the shortest s-t path problem 168
7.4 Increasing multiple variables at once: the generalized Steiner tree problem 170
7.5 Strengthening inequalities: the minimum knapsack problem 178
7.6 The uncapacitated facility location problem 180
7.7 Lagrangean relaxation and the k-median problem 184

8 Cuts and metrics 195
8.1 The multiway cut problem and a minimum-cut based algorithm 196
8.2 The multiway cut problem and an LP rounding algorithm 197
8.3 The multicut problem 203
8.4 Balanced cuts 208
8.5 Probabilistic approximation of metrics by tree metrics 211
8.6 An application of tree metrics: Buy-at-bulk network design 216
8.7 Spreading metrics, tree metrics, and linear arrangement 220

To be published by Cambridge University Press

II Further uses of the techniques 231

9 Further uses of greedy and local search algorithms 233
9.1 A local search algorithm for the uncapacitated facility location problem 234
9.2 A local search algorithm for the k-median problem 239
9.3 Minimum-degree spanning trees 243
9.4 A greedy algorithm for the uncapacitated facility location problem 247

10 Further uses of rounding data and dynamic programming 257
10.1 The Euclidean traveling salesman problem 257
10.2 The maximum independent set problem in planar graphs 269

11 Further uses of deterministic rounding of linear programs 281
11.1 The generalized assignment problem 282
11.2 Minimum-cost bounded-degree spanning trees 286
11.3 Survivable network design and iterated rounding 297

12 Further uses of random sampling and randomized rounding of linear programs 309
12.1 The uncapacitated facility location problem 310
12.2 The single-source rent-or-buy problem 313
12.3 The Steiner tree problem 316
12.4 Everything at once: finding a large cut in a dense graph 322

13 Further uses of randomized rounding of semidefinite programs 333
13.1 Approximating quadratic programs 334
13.2 Coloring 3-colorable graphs 340
13.3 Unique games 344

14 Further uses of the primal-dual method 355
14.1 The prize-collecting Steiner tree problem 355
14.2 The feedback vertex set problem in undirected graphs 360

15 Further uses of cuts and metrics 369
15.1 Low distortion embeddings and the sparsest cut problem 369
15.2 Oblivious routing and cut-tree packings 376
15.3 Cut-tree packings and the minimum bisection problem 382
15.4 The uniform sparsest cut problem 385

16 Techniques in proving the hardness of approximation 407
16.1 Reductions from NP-complete problems 407
16.2 Reductions that preserve approximation 412
16.3 Reductions from probabilistically checkable proofs 420
16.4 Reductions from label cover 425
16.5 Reductions from unique games 437

17 Open Problems 447

A Linear programming 453
